Cambridge Imaging Systems showcase “easy” archive solutions at IBC 2012

Cambridge, August 2012 – Cambridge Imaging Systems, the digital archive management specialist, is exhibiting its new Imagen release, the latest in its series of advanced media asset management and publishing systems, at IBC 2012, Amsterdam, 7 - 11 September.

Imagen2 has been developed to manage very large collections of media files for libraries and museums, commercial clip libraries, photo, sound and film collections. Imagen can be connected by local or wide area networks and various forms of Internet access can be used.

The new Imagen2.7 release provides fresh management interfaces, giving even greater flexibility. Service performance monitoring has also been added and access to the service log for diagnostics is especially easy. It is also designed for easy installation, without the need for support from the developers.

Ian Mottashed, Director, Cambridge Imaging Systems, said:

“In this age of ‘plug and play’ even the most sophisticated systems, intended for professional and enterprise markets, need to be simple to install and activate. Our new version of Imagen provides resellers with a state-of-the-art system that can be deployed with the minimum of outside expertise.”

Cambridge Imaging Systems is exhibiting in association with Global Distribution on stand 7.G16. Media attending the event are welcome to visit the stand for a working demonstration of the new system.
